

# INOCULATED SEED

# QWIKGROW™

*QWIKGROW is Quality Seeds West's exclusive legume seed inoculation process. It ensures the perfect high strength inoculant strain is adhered to each and every seed with a highly visible, water-soluble polymer-coat. QWIKGROW makes for a headache free project ... it's no muss, no fuss, cost effective, and it works!*

## IN A NUTSHELL

### QWIKGROW

#### provides:

- Increased emergence
- Thicker stands
- Stronger plants
- Increased nitrogen fixation
- High strength, species specific inoculation
- An easy-to-spot, highly visible application
- A headache-free project...forever eliminate guess-work and the handling of messy inoculant packets!

QWIKGROW is a process exclusive to Quality Seeds West, where legume seeds are inoculated and then covered with a highly visible, water-soluble polymer coating. This process affixes the correct strain of Rhizobia particular to that legume species (i.e. alfalfa, clover, birdsfoot trefoil) to the seeds during mixing so it is immediately available at planting time. Other pre-inoculation systems depend only on static electricity to keep the inoculant with the seed during mixing.

However, in the QWIKGROW process, the correct strain of Rhizobia is "bound" to the seed with a highly visible, "green" polymer coating. PLUS, in addition to using the correct strain of Rhizobia for nitrogen fixation, different colorants (blue, red, etc.) and nutrient packages can be added in the QWIKGROW process to ensure longer viability of the bacteria and to aid in site-specific seed distribution.

Trust QWIKGROW for superior legume seed enhancement.

## HIGHLIGHTS:

- The high strength polymer is soluble in moisture, allowing water transfer to the seed, ensuring germination
- Each seed is inoculated for more even stands
- High quality inoculant is used to guarantee good nodulation of the legume roots for superior nitrogen fixation
- The inoculant is bound to the seed and remains effective during all facets of seeding (including mixing with grasses and other legumes, seed handling, drill and aerial seeding)

- The addition of colorants to the seed provides a visual confirmation of inoculation and makes application calibration easier.
